Portal Pressure Simulator

Beta tester start-up guide

Created by Mohammad Almeqdadi, MD

1 Open the preview link

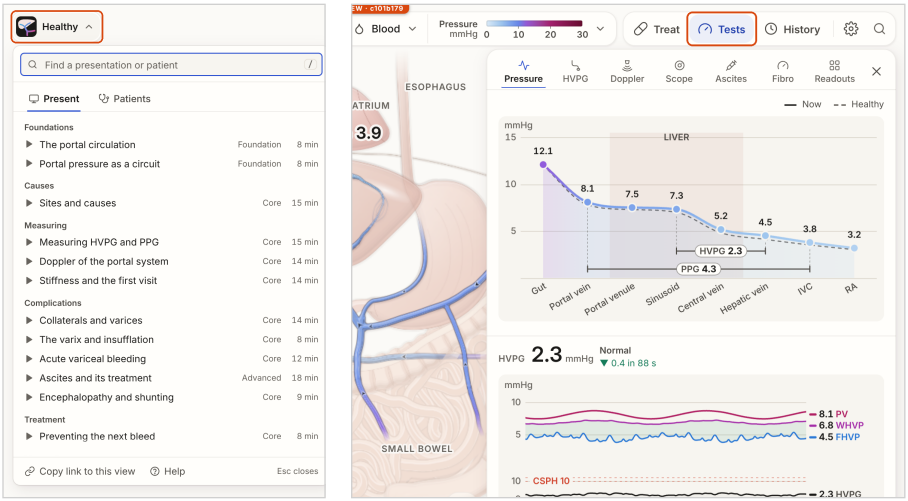

Go to **https://qaddodi.github.io/portal-pressure-simulator/preview/** in a current browser on a Mac, iPad or iPhone. Nothing to install and no account. A short loading screen draws the blood up into the liver while the app opens. **iPhone or iPad:** in Safari tap Share, then **Add to Home Screen**, and open the app from its icon for the full-screen view. The small orange **PREVIEW** tab at the top shows which build you are on. Tap it to load the newest version.

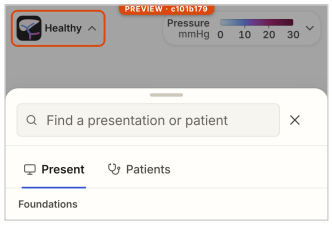

The orange PREVIEW tab, top centre on Mac (left) and iPhone (right).

2 The two most important buttons

Main menu (top left, shows the patient name, "Healthy" here): opens the list of presentations and patients. On **Present** pick a talk to play it; on **Patients** pick a case to load. It also has search, Copy link to this view and Help. **Tests**: opens the Tests card with tabs for Pressure, HVPG, Doppler, Scope, Ascites, Fibro and Readouts, the measurements you can take on this patient.

Mac: the main menu opened (left) and Tests opened (right).

On iPhone the same two buttons: the main menu is still top left, and Tests is in the bar along the bottom (Treat, Tests, History, Layers, Settings). Tests tabs show as icons; the open tab shows its name.

3 Change something and watch every number follow

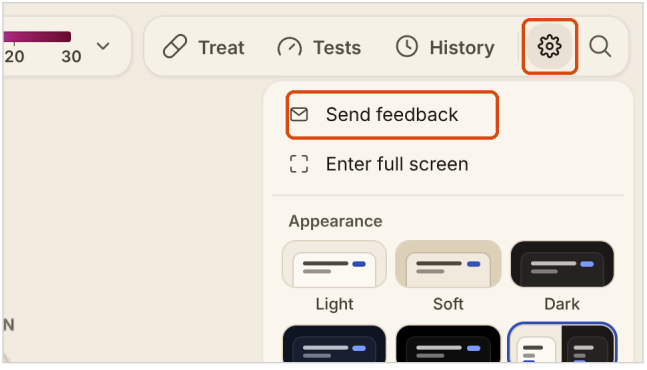

Tap a vessel (or the liver) on the figure. A card opens with sliders: **Narrow** and **Clot** change that vessel, and **Doppler**, **Inject dye** and **Add shunt** are one tap away. In **Patients**, pick a case and try something from **Treat**. The pressures, colors and tiles update at once.

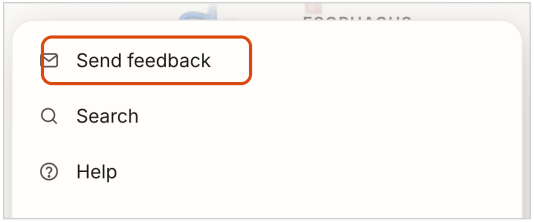

Mac: the portal vein selected (left). iPhone: a vessel card at the bottom (right).

4 Send feedback

Tap the **gear** (Settings, in the bottom bar on iPhone), then **Send feedback**. It starts an email to Mohammad with your build, device, screen and a link to the exact view you were on. Nothing is sent until you send the email. After about 10 minutes of use, a card also asks once if you want to send feedback. Settings also has **Appearance** (Light, Dark, Soft or System).

Tap the gear, then Send feedback: on Mac (left) and on iPhone (right).

5 When you report a problem

Take a screenshot that shows the orange **PREVIEW** tab at the top, so the build is clear, and say what you were doing. Slow, confusing or broken: all of it helps.
