Portal Pressure Simulator

Beta tester start-up guide

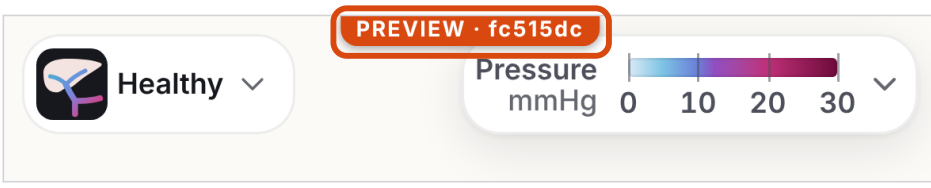

Created by Mohammad Almeqdadi, MD

1 Open the preview link

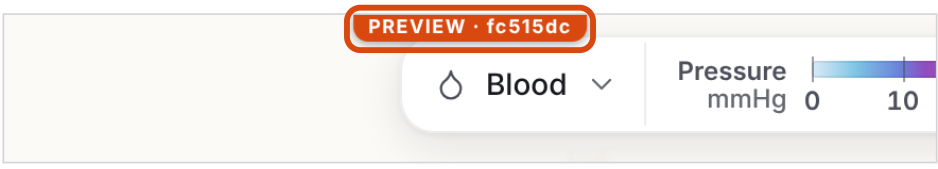

Go to **https://qaddodi.github.io/portal-pressure-simulator/preview/** in a current browser on a Mac, iPad or iPhone. Nothing to install and no account.

iPhone or iPad: in Safari tap Share, then **Add to Home Screen**, and open the app from its icon for the full-screen view.

The small orange **PREVIEW** tab at the top shows which build you are on. Tap it to load the newest version.

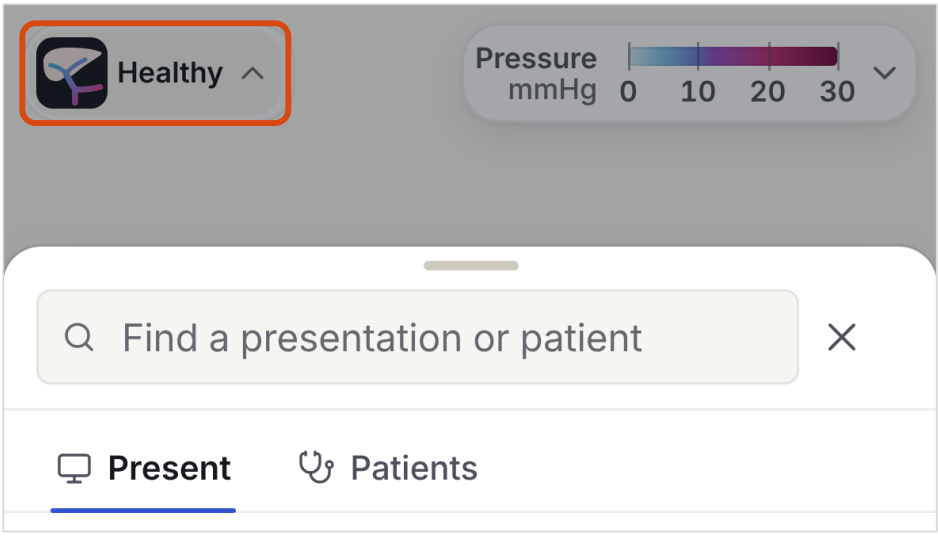

iPhone: the orange PREVIEW tab, top centre.

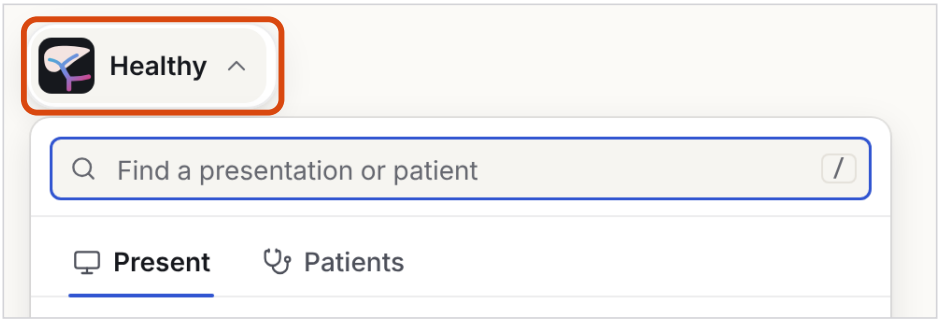

Mac: the same tab.

2 The two most important buttons

Main menu (top left, shows the patient name, "Healthy" here): opens the list of presentations and patients. On **Present** pick a talk to play it; on **Patients** pick a case to load. It also has search, Copy link to this view and Help.

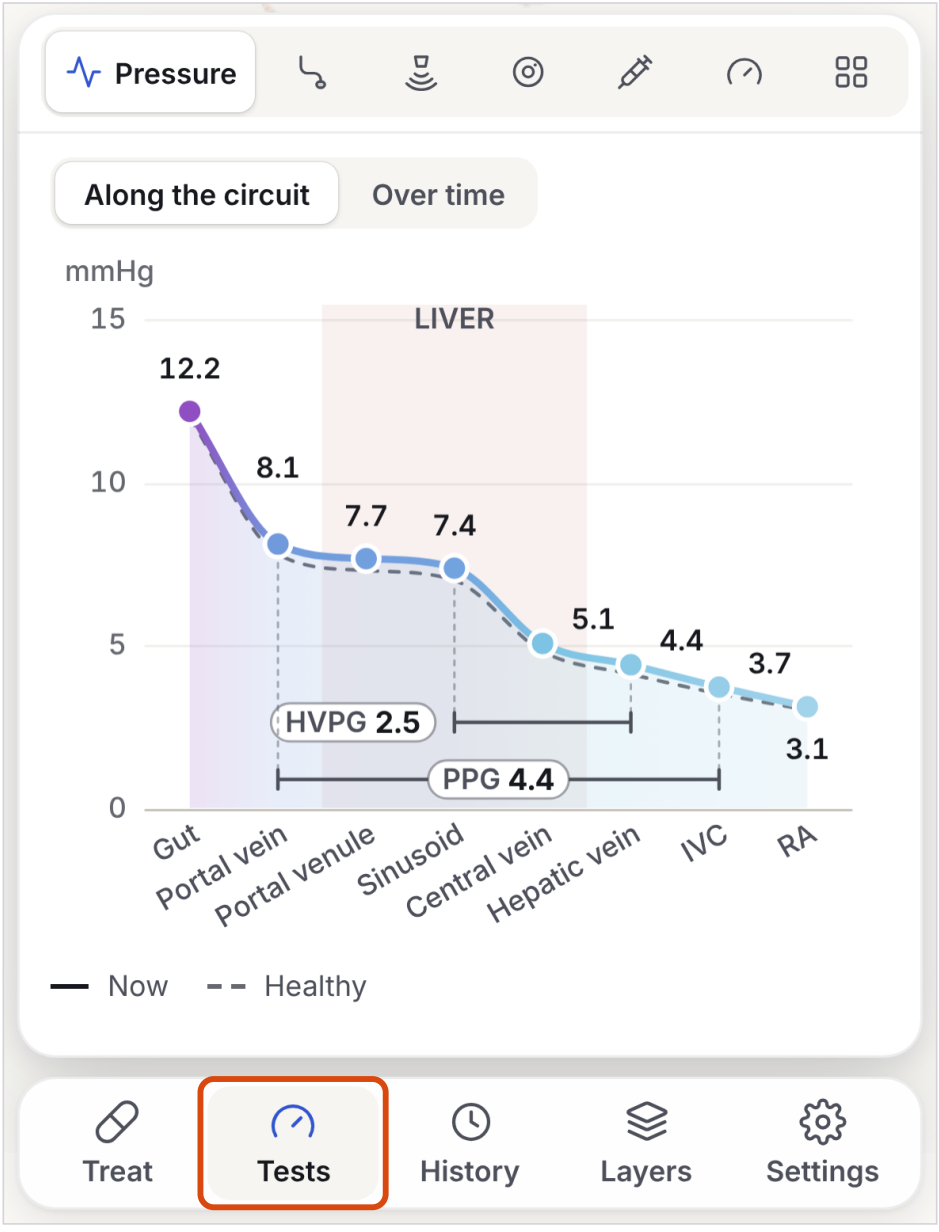

iPhone: the main menu opened.

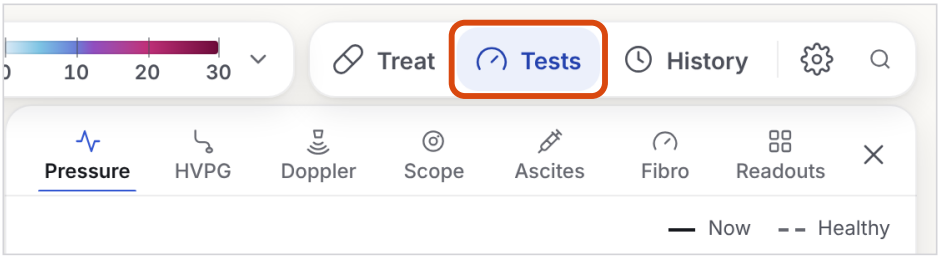

Mac: the main menu opened.

Tests: opens the Tests card with tabs for Pressure, HVPG, Doppler, Scope, Ascites, Fibro and Readouts, the measurements you can take on this patient. On iPhone it is in the bar along the bottom (Treat, Tests, History, Layers, Settings), and the tabs show as icons.

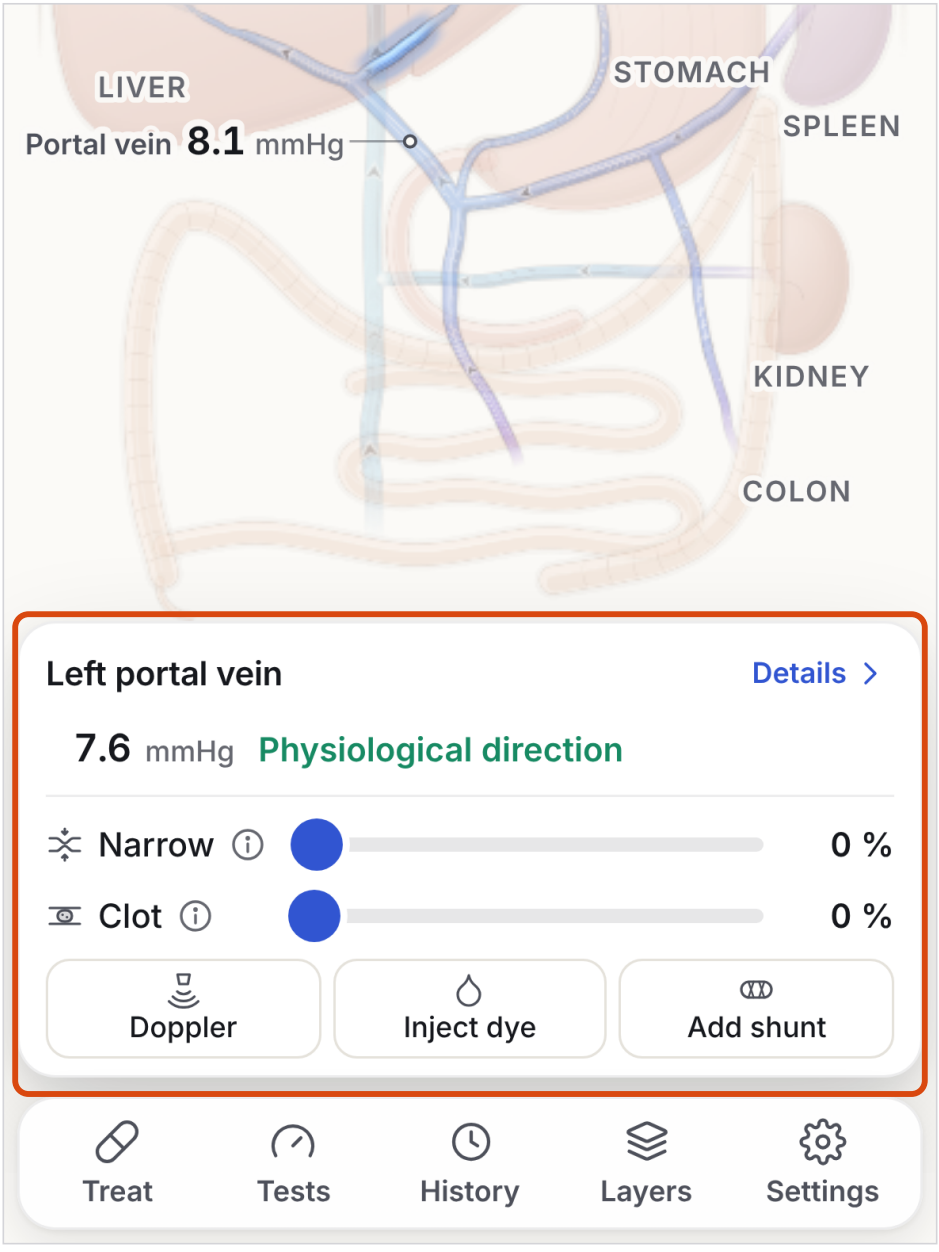

iPhone: Tests opened.

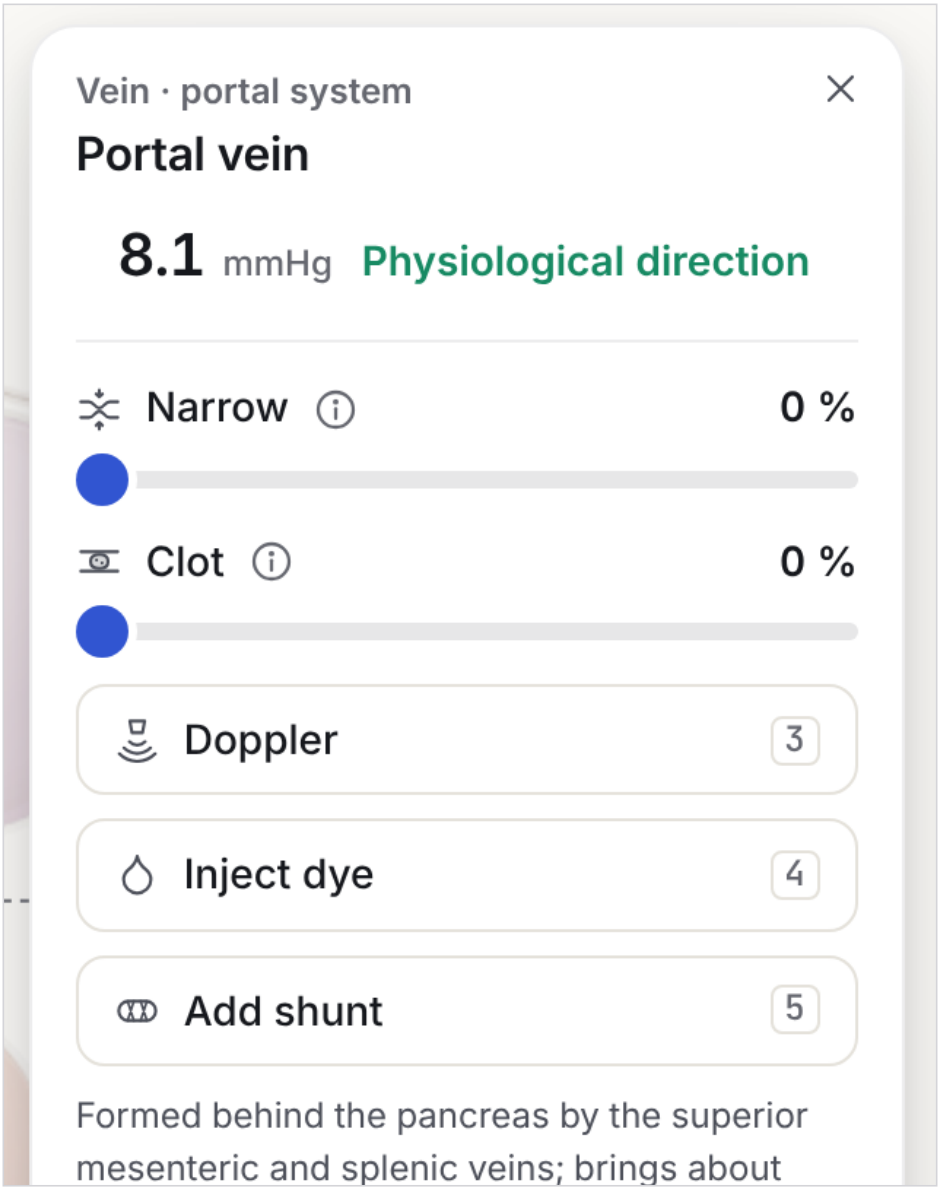

Mac: Tests opened.

3 Change something

Tap a vessel (or the liver) on the figure. A card opens with sliders: **Narrow** and **Clot** change that vessel, and **Doppler**, **Inject dye** and **Add shunt** are one tap away. In **Patients**, pick a case and try something from **Treat**. The pressures, colors and tiles update at once.

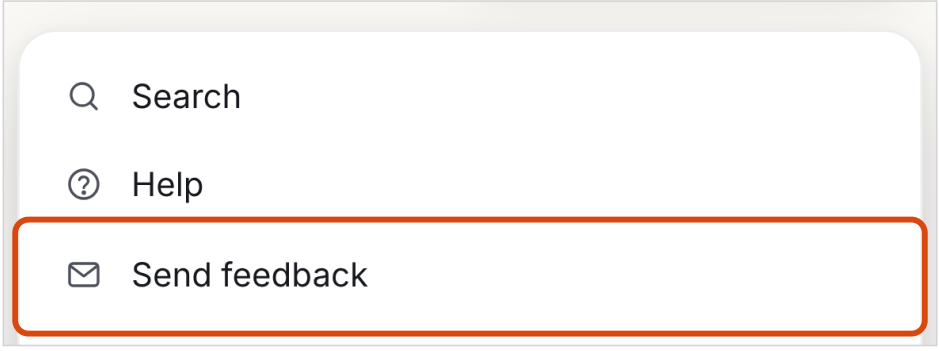

iPhone: a vessel card at the bottom.

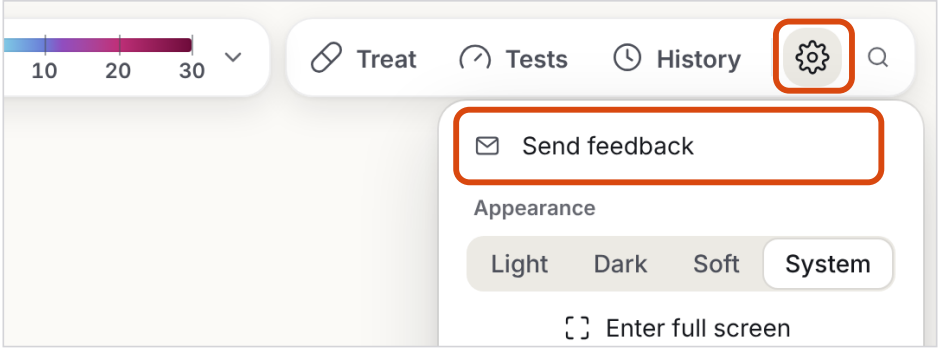

Mac: the portal vein selected (top of its card).

4 Send feedback

Tap the **gear** (Settings, in the bottom bar on iPhone), then **Send feedback**. It starts an email to Mohammad with your build, device, screen and a link to the exact view you were on. Nothing is sent until you send the email. After about 10 minutes of use, a card also asks once if you want to send feedback.

iPhone: Settings, then Send feedback.

Mac: the gear, then Send feedback.

5 When you report a problem

Take a screenshot that shows the orange **PREVIEW** tab at the top, so the build is clear, and say what you were doing. Slow, confusing or broken: all of it helps.
